Public release summary

Release date 7 November 2026. Author and copyright holder Amir Hossein Mozafari.

Release snapshot

The second commit is 6bab9e940e8ec451303a1fea62ea9e543445aeb0. The first commit is preserved. The committed release contains 1,321 files totaling 90,604,007 bytes (90.60 MB). Git metadata occupies 21.52 MB. No payload file exceeds 50 MB. No remote is configured and no push was run.

The source project was read only. All 1,281 approved source files were copied individually. No complete junction target tree, original Git history, checkpoint, optimizer state, tensor cache, raw NASA file, partial download or old manuscript was copied.

Manuscript and verification

The requested abstract limits sentence is restored exactly. The abstract has 166 words. All 672 numeric literals remain identical in order. Table cells, equations, citations, protocol hashes, conclusions and the AI declaration are unchanged. The rebuilt manuscript PDF has 11 pages. Document checks pass for 79 prose blocks, 40 table rows and S0-S14 references. The 50-page supplement is unchanged by this final edit.

Phase 2 public CSV reproduction and cross-head arithmetic checks passed. They use included prediction labels for consistency, rather than independent NASA-label verification. The optional extremal-example check is omitted because its CSV was outside the approved list. No new fitting, inference, resampling or CIs were run.

Exclusions, integrity and licensing

Exactly 185 hash-referenced files are omitted. docs/excluded_hash_referenced.csv gives their relative locations, expected SHA-256 and referencing locks. Full verification needs the author's local archive. NASA download instructions and known raw-file hashes are in docs/.

All 333 immutable copied records remain byte-identical; docs/locked_files.csv lists them. The five approved execution records preserve original local paths. The private inventory is ignored under docs/phase1_inventory/, and local build files are ignored under .build/. Neither is in Git or the public checksum manifest. release_tree.txt lists the distributable files with sizes and excludes these ignored directories and Git metadata.

Code is MIT licensed. Derived result CSVs and predictions use CC BY 4.0. NASA raw data are not redistributed and remain under NASA's terms. [REPO_URL] and [ZENODO_DOI] remain placeholders.

This is a single-benchmark, exploratory study using examined data. Independent human review is missing. The workflow is AI-assisted, and the same tool performed the checks.

This summary and the release tree were generated after the second commit as requested. They, the Phase 3 cleanup-log entry and the refreshed checksum manifest are not included in that commit.
